Utility to Equity Tokenization

Hacken Trailblazes Utility to Equity Swap

Hacken, a leading auditor in the Blockchain Security Space, has allowed $HAI holders to be the first to ever be offered the possibility to convert Utility Tokens to Equity Tokens with a stake directly in the Hacken Enterprise. This groundbreaking move marks a new era for tokenized public companies and digital assets.

- Having audited over 1,200 projects, including the likes of 1INCH, Sandbox, and DAO Maker, Hacken has emerged as one of the most reputable auditing firms in the blockchain industry.

- Hacken is charting new territory by becoming the first-ever company to offer its holders the potential to significantly transform their relationship with the company. Now, holders will have the opportunity to exchange their native Hacken Token ($HAI) — traditionally a work-to-earn, product-utility, and governance token — for a direct ownership stake in the company through a conversion into Equity Tokens.

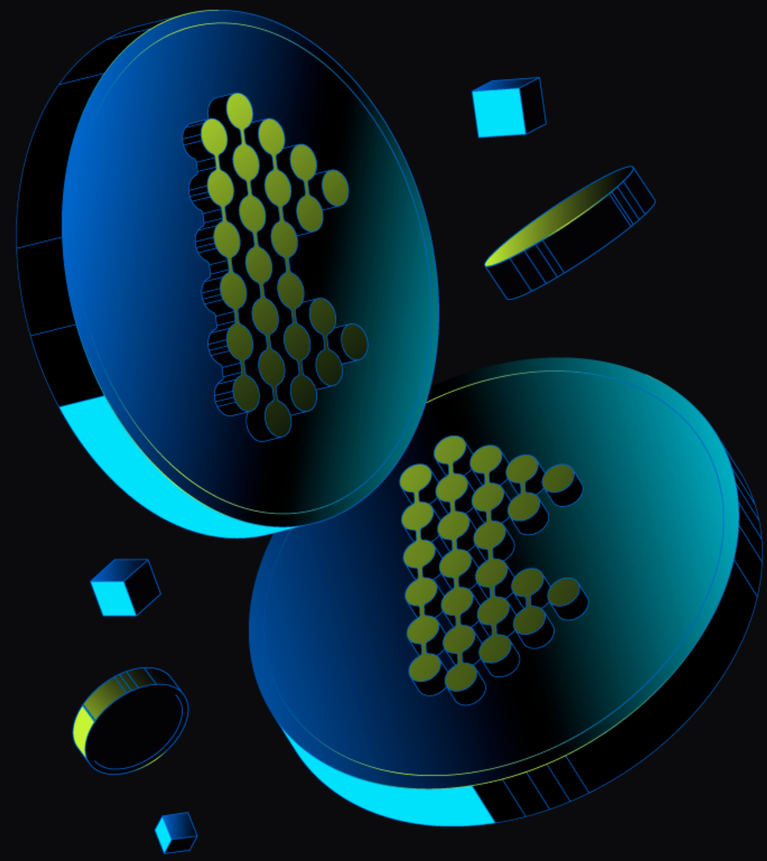

Why Convert from Utility to Equity?

Equity, Debt, and Profit Share tokenizations offer institutions versatile options for capital generation and portfolio management:

- Alignment of Interests: Converting utility tokens to equity tokens aligns the interests of token holders and equity shareholders. It fosters a shared vision for the company's success, as both parties benefit from the company's growth.

- Increased Token Value and Demand: By offering the option to swap utility tokens for equity, companies like Hacken increase the value proposition of their utility tokens. This versatility creates higher demand for utility tokens in the market, consequently boosting their value.

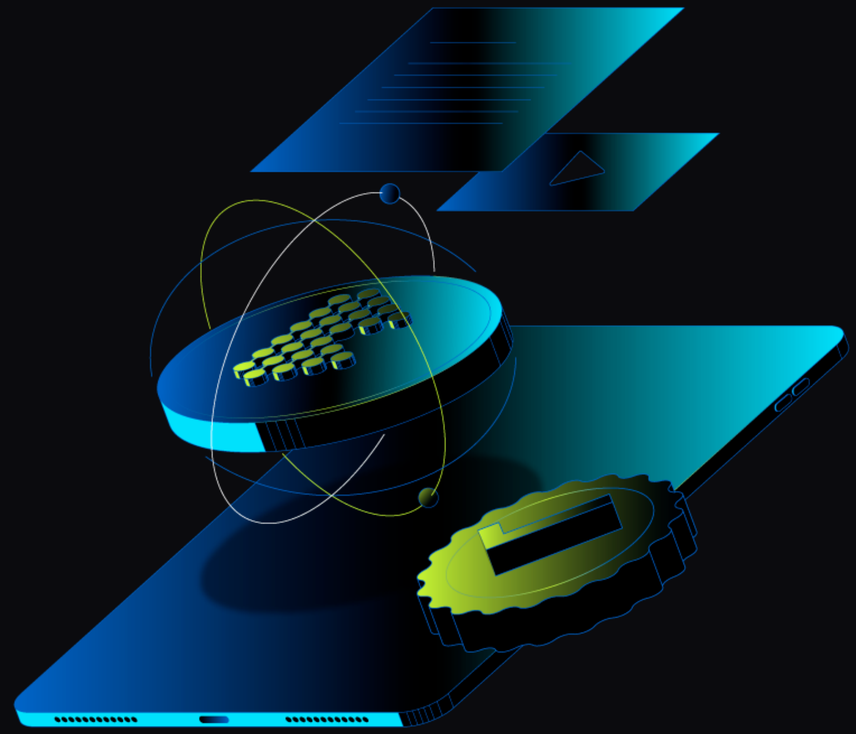

Benefits of Community Involvement

- Enhanced Engagement: Allowing community members to convert tokens fosters a deeper connection with the company. This increased involvement can lead to greater engagement in community-driven initiatives and decision-making processes.

- Community Advocacy: Empowering the community through token conversion can result in passionate advocacy. Engaged stakeholders often become vocal advocates, attracting more users and investors to the platform.

- Improved Feedback Loop: A more involved community often provides valuable insights and feedback. Their input can contribute significantly to product improvement and development, fostering a more responsive and customer-centric approach.
